

Common Typographic Diseases

Various forms of dysfunction appear among populations exposed to typography for long periods of time. Listed here are a number of frequently observed afflictions.

Typochondria

Typochondria

A persistent anxiety that one has selected the wrong typeface. This condition is often paired with optical kerning disorder (OKD), the need to constantly adjust and readjust the space between letters.

Typophiliaalone.

Typophilia

An excessive attachment to and fascination with the shape of letters, often to the exclusion of other interests and object choices. Typophiliacs usually die penniless and alone.

Typophobia

The irrational dislike of letterforms, often marked by a preference for icons, dingbats, and—in real fatal cases—bullets and daggers. The fears of the typophobe can often be quieted (but not cured) by steady doses of Helvetica and Times Roman.
